What this strategy does

Calm Weighted plus the Volatility Filter

Why it should work. Skip the cells that history says do not pay -- but the data shows a gradient, not a bad cell.

Design notes (from the strategy's source file).

Volatility Filter (and Calm Weighted Filter) -- skip stock groups that have not paid, judged only on past data.

Drops a (side, idio-vol tercile) cell from new entries when its own history says it has not earned its keep, judged ONLY on quarters whose positions had fully exited. Result: filtering does not help on its own (Sharpe 1.23 vs 1.30 baseline-equivalent run; the effect is a smooth gradient, not one broken cell) and adds nothing once inverse-vol sizing is on (Calm Weighted Filter 1.41 < Calm Weighted 1.47). Kept as a documented negative result: size by vol, do not filter by it.

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	33.61	-11.85
P&L after costs ($M)	30.87	-14.73
of which common (average-event) component ($M)	21.76	-22.12
of which excess / PEAD component ($M)	11.84	10.26
excess minus costs ($M)	9.11	7.39
gross return per $ traded (bp)	247.89	-86.16
positions in the money (hit rate)	0.56	0.48
stand-alone Sharpe (leg only)	1.27	-0.35

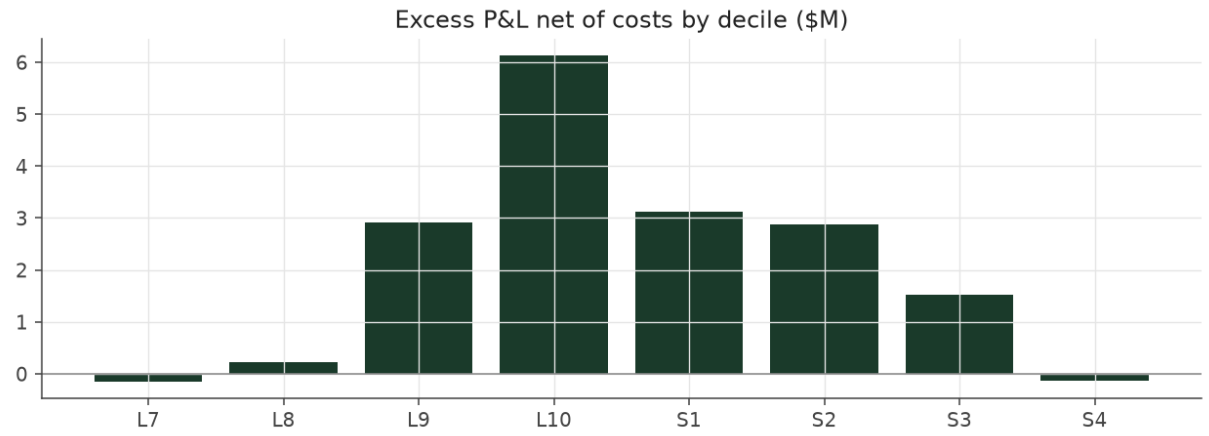

Daily P&L correlation between the two legs: **-0.78**.

• **The short leg loses money in absolute terms** (-11.9M before costs) while the long leg earns +33.6M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 21.8M / 22.1M. Stripping that common component, the surprise signal itself earned +11.8M on the long side and +10.3M on the short side.

• The two legs' daily P&L are -0.78 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 1.27 long / -0.35 short vs 1.08 combined).

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
