What this strategy does

Calm Weighted plus the Volatility Filter

Why it should work. Skip the cells that history says do not pay -- but the data shows a gradient, not a bad cell.

Design notes (from the strategy's source file).

Strategy 9a / 9c -- walk-forward volatility-cell filter (alone and combined with inverse-vol).

Drops a (side, idio-vol tercile) cell from new entries when its own history says it has not earned its keep, judged ONLY on quarters whose positions had fully exited. Result: filtering does not help on its own (Sharpe 1.23 vs 1.30 baseline-equivalent run; the effect is a smooth gradient, not one broken cell) and adds nothing once inverse-vol sizing is on (9c 1.41 < 9b 1.47). Kept as a documented negative result: size by vol, do not filter by it.

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	42.03	-10.89
P&L after costs ($M)	38.76	-14.42
of which common (average-event) component ($M)	26.55	-27.19
of which excess / PEAD component ($M)	15.48	16.30
excess minus costs ($M)	12.21	12.77
gross return per $ traded (bp)	253.44	-64.00
positions in the money (hit rate)	0.56	0.49
stand-alone Sharpe (leg only)	1.33	-0.25

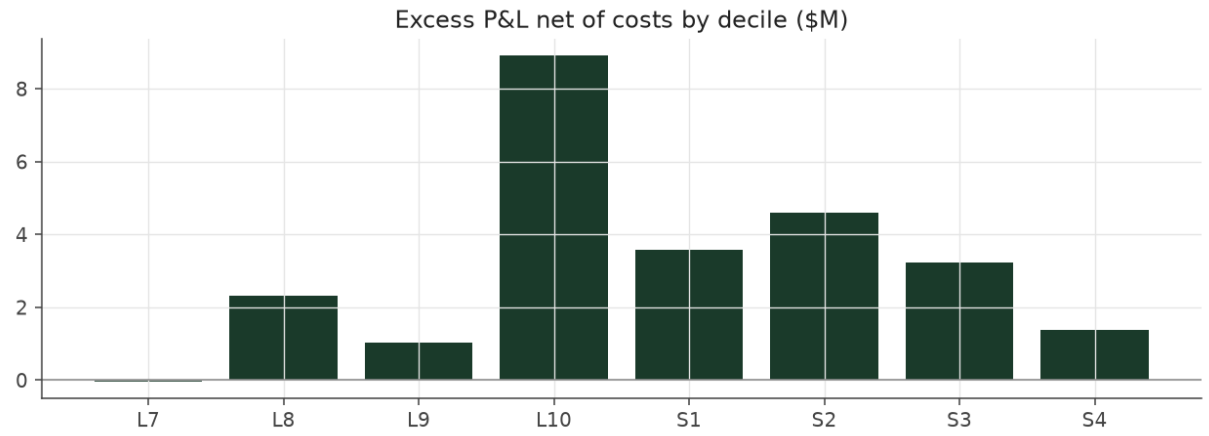

Daily P&L correlation between the two legs: **-0.81**.

• **The short leg loses money in absolute terms** (-10.9M before costs) while the long leg earns +42.0M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 26.5M / 27.2M. Stripping that common component, the surprise signal itself earned +15.5M on the long side and +16.3M on the short side.

• The two legs' daily P&L are -0.81 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 1.33 long / -0.25 short vs 1.41 combined).

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
