What this strategy does

Balanced Leverage, with each bet divided by how jumpy the stock is

Why it should work. PEAD is a stronger, cleaner signal in low-vol stocks; size positions by inverse risk.

Design notes (from the strategy's source file).

Strategy 9b -- Strategy 6 sized by inverse idiosyncratic volatility.

Within every (quarter, side, sector, size) cell, each event's weight is scaled by 1/ivol, so calm stocks get more capital than wild ones. Rationale: the earnings drift is worth more per unit of risk in low-vol names (the SUE x vol interaction is t = -2.4 to -2.7 in Fama-MacBeth), and the engine's cost/liquidity model charges the same bps regardless of vol. Raises Sharpe 1.30 -> 1.47 with no fitted parameter, in all three sub-eras.

`InverseVolVolMatched` re-sizes it to Strategy 6's exact volatility to answer "at the SAME risk, how much more return": 7.31% vs 6.49%.

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	43.18	-10.78
P&L after costs ($M)	39.82	-14.40
of which common (average-event) component ($M)	27.28	-27.98
of which excess / PEAD component ($M)	15.90	17.20
excess minus costs ($M)	12.54	13.57
gross return per $ traded (bp)	253.23	-61.58
positions in the money (hit rate)	0.56	0.49
stand-alone Sharpe (leg only)	1.33	-0.23

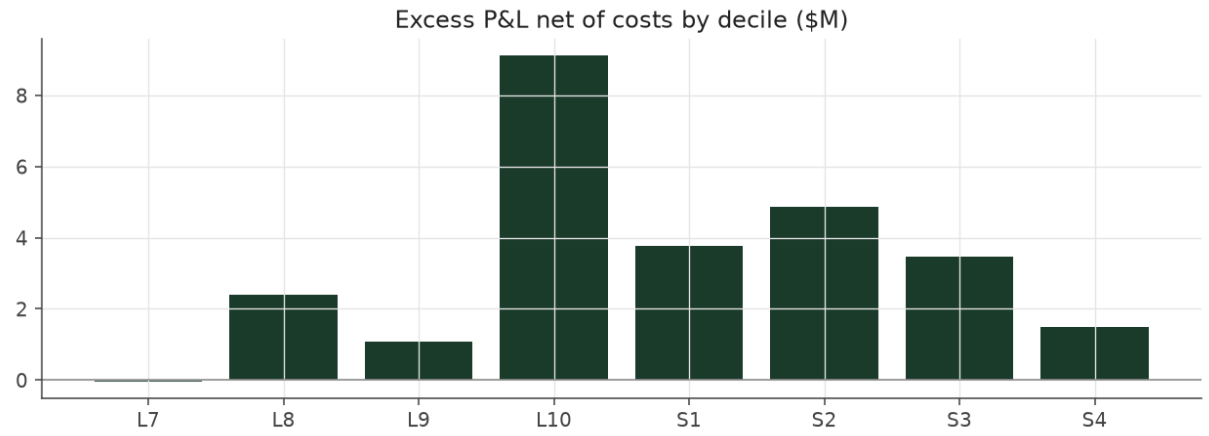

Daily P&L correlation between the two legs: **-0.81**.

• **The short leg loses money in absolute terms** (-10.8M before costs) while the long leg earns +43.2M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 27.3M / 28.0M. Stripping that common component, the surprise signal itself earned +15.9M on the long side and +17.2M on the short side.

• The two legs' daily P&L are -0.81 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 1.33 long / -0.23 short vs 1.47 combined).

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
