conviction_tilt_max

equity strategy | family: equity-max | status: research | derived from `conviction_tilt`

What this strategy does

conviction_tilt with bigger bets for more return: base unit 0.007, 6x leverage cap

Why it should work. Concentrate capital where the surprise is largest; neutralize size so it is not a hidden bet.

Design notes (from the strategy's source file).

Max-size variants ("<name>_max") of the hand-built equity strategies.

Same signal, trim, tilt and neutralization as each base strategy; only the two dials that set how big and how levered the book is change (base_unit_fraction, gross-leverage cap = 6x). The multiplier for each was picked by sweeping 1.5x..12x the original base unit and taking the highest return subject to Sharpe >= 0.6 and max drawdown >= -40% (a worse drawdown is a fund-ending event, not a risk preference). The untouched 5%-of-ADV liquidity cap remains the real capacity constraint, and bites roughly four times as often at this sizing.

These are generated from the base strategy classes, so a change to a base strategy's weights flows through automatically.

parameter	value
base_unit_fraction	0.007
max_gross_leverage	6.0
liquidity_cap_frac	0.05
return_basis	mktadj
cap_mode	priority
exposure_cap	open_book
beta_overlay	0.0

Performance

metric	conviction tilt max	market (CRSP VW)
Annualized return	9.26%	9.94%
Annualized volatility	12.65%	19.35%
Sharpe (NAV-pct)	0.76	0.59
Sortino	1.09	
Max drawdown	-40.5%	-55.5%
Calmar	0.23	
Final NAV ($10M start)	$56,133,710	
Worst day	-7.25%	
% positive days	49.8%	
Sharpe 1996-2001	1.08	

Sharpe 2002-2007	1.45	
Sharpe 2008-2013	-0.05	

Correlation of daily returns with the market: **0.04**.

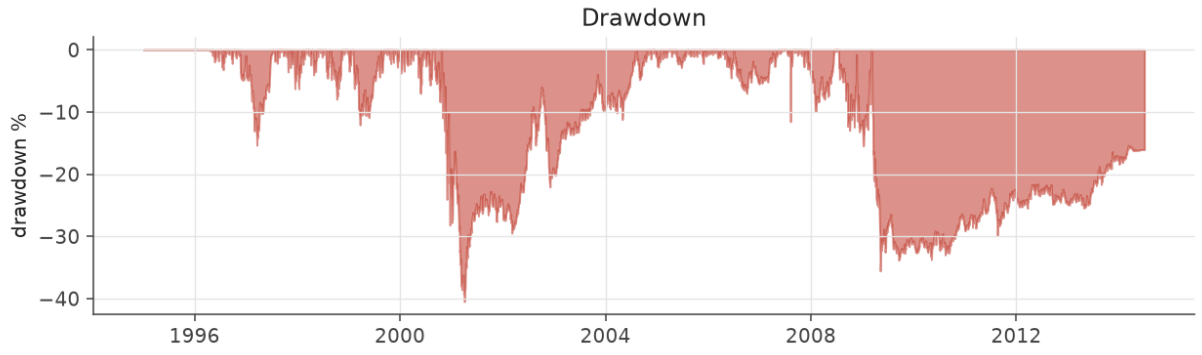

• best Sharpe among equity: `calm_rank_tilt` (1.81); this one: 0.764

• best return among equity: `market_boost_max` (0.15); this one: 0.0926

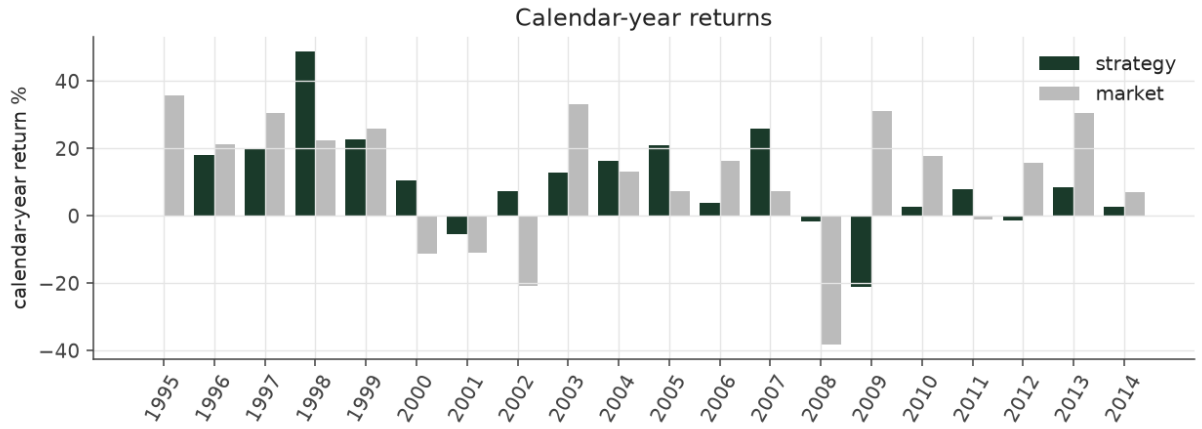

• best Calmar among equity: `calm_rank_tilt` (0.614); this one: 0.229

NAV (log scale)

Drawdown from running peak

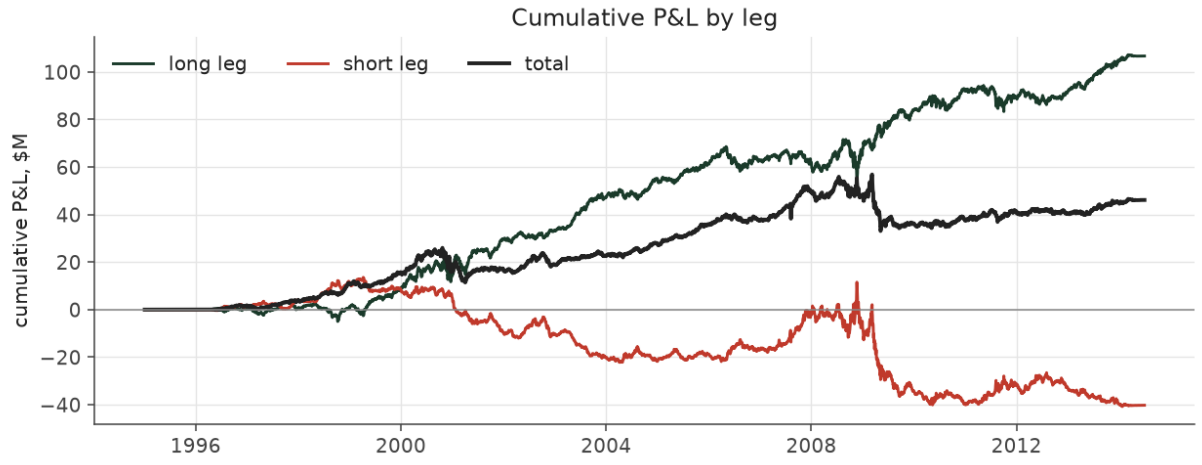

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	106.73	-40.24
P&L after costs ($M)	96.86	-50.72
of which common (average-event) component ($M)	87.76	-89.04

of which excess / PEAD component ($M)	18.97	48.80
excess minus costs ($M)	9.10	38.32
gross return per $ traded (bp)	191.03	-70.48
positions in the money (hit rate)	0.56	0.48
stand-alone Sharpe (leg only)	0.91	-0.23

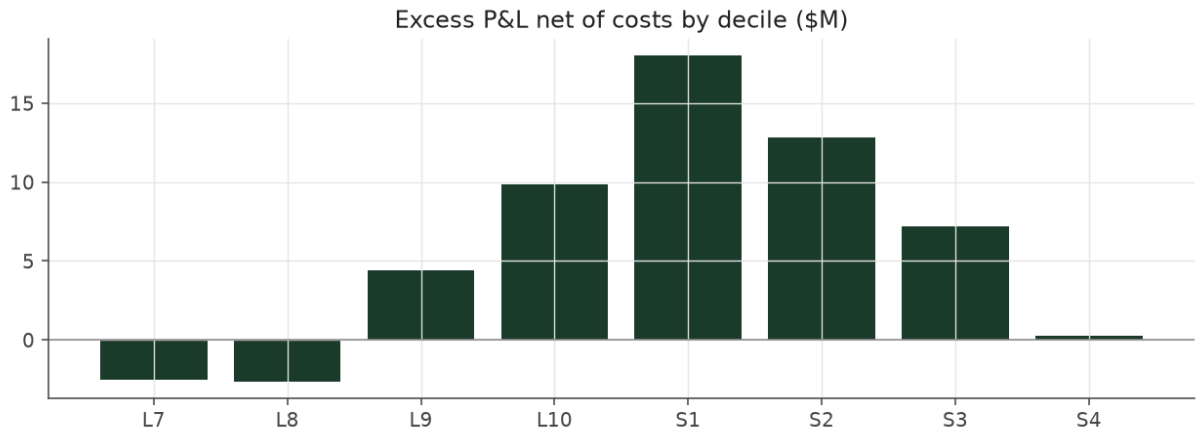

Daily P&L correlation between the two legs: **-0.73**.

• **The short leg loses money in absolute terms** (-40.2M before costs) while the long leg earns +106.7M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 87.8M / 89.0M. Stripping that common component, the surprise signal itself earned +19.0M on the long side and +48.8M on the short side.

• The two legs' daily P&L are -0.73 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 0.91 long / -0.23 short vs 0.76 combined).

By decile and side (signal-driven part only)

leg	decile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $
long	7	6,507	350.56	3.01	-1.84	0.66	-2.50	-5.3%	-71.27
long	8	16,600	1,189.48	17.66	-0.49	2.17	-2.66	-5.6%	-22.39

5.0%	56.4	-100.00%	109.26%

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
