sector_balanced

equity strategy | family: equity-neutralized | status: validated | derived from `conviction_tilt`

What this strategy does

Conviction Tilt, also balanced across 12 industry groups; conservative 1.5x borrowing limit

Why it should work. Same drift, with sector and size risk diversified away so only the earnings signal is left.

Design notes (from the strategy's source file).

Sector Balanced -- Conviction Tilt plus an equal budget for each industry group.

A diagnostic found Conviction Tilt's book putting up to 29% of gross weight in one FF12 sector in some quarters (8.3% if spread evenly): an unpriced bet unrelated to earnings drift. Neutralizing each (side, size, sector) cell to an equal budget removes it. Best Sharpe / shallowest drawdown of the hand-built strategies at its conservative 1.5x leverage cap.

parameter	value
base_unit_fraction	0.0015

Performance

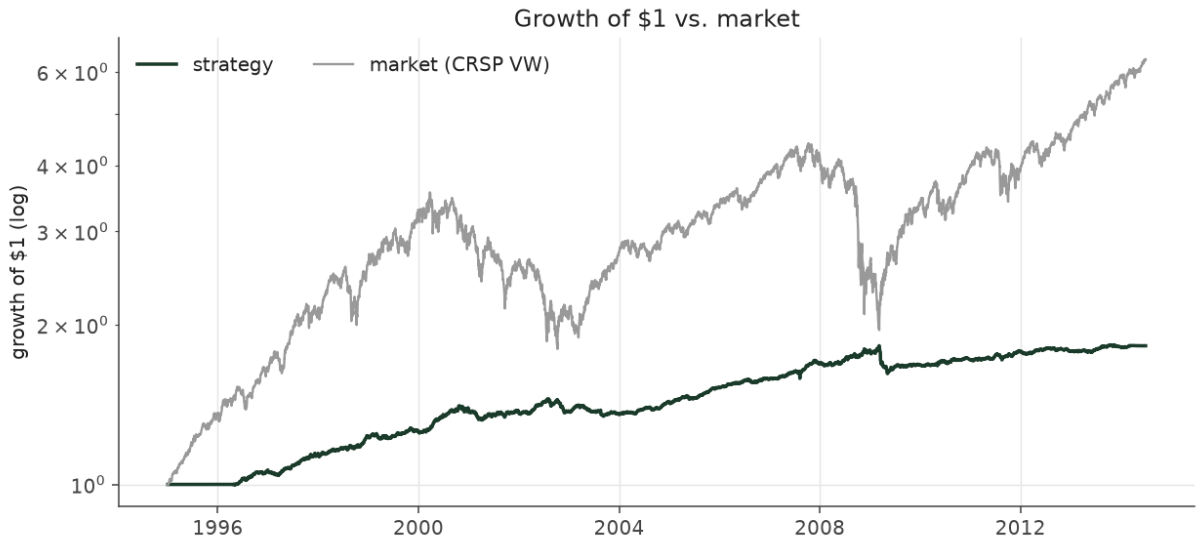

metric	sector balanced	market (CRSP VW)
Annualized return	3.14%	9.94%
Annualized volatility	2.89%	19.35%
Sharpe (NAV-pct)	1.08	0.59
Sortino	1.52	
Max drawdown	-11.4%	-55.5%
Calmar	0.28	
Final NAV ($10M start)	$18,260,949	
Worst day	-3.27%	
% positive days	50.8%	
Sharpe 1996-2001	1.72	
Sharpe 2002-2007	1.25	
Sharpe 2008-2013	0.41	

Correlation of daily returns with the market: **-0.00**.

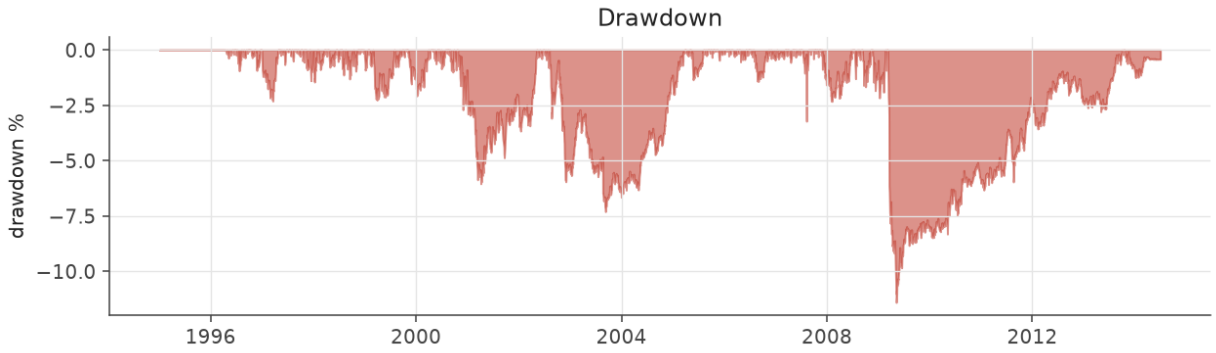

• best Sharpe among equity: `calm_rank_tilt` (1.81); this one: 1.08

• best return among equity: `market_boost_max` (0.15); this one: 0.0314

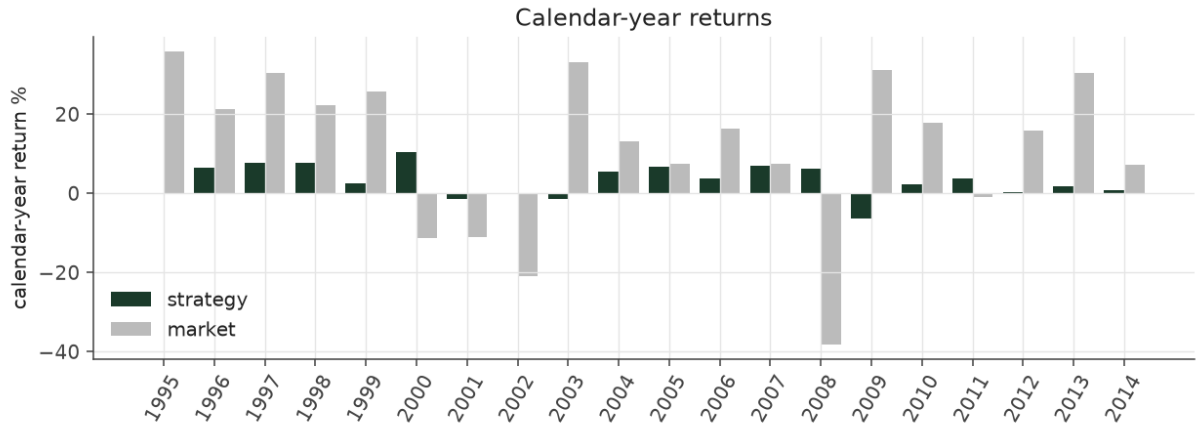

• best Calmar among equity: `calm_rank_tilt` (0.614); this one: 0.275

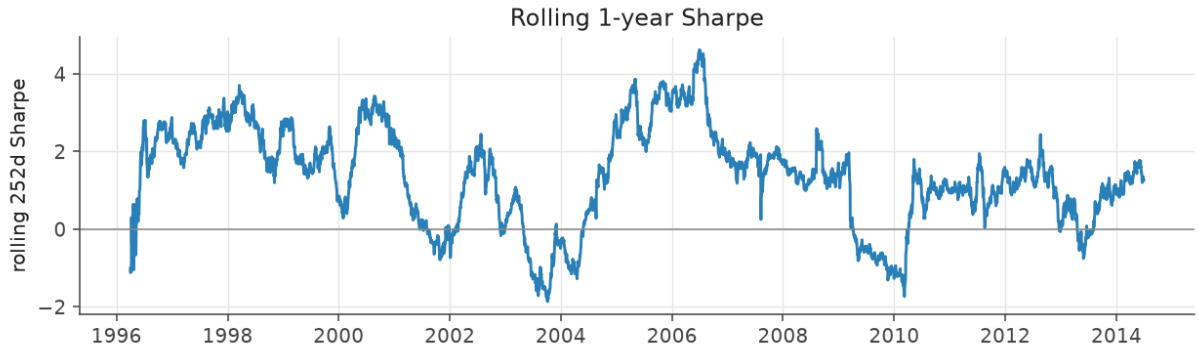

NAV (log scale)

Drawdown from running peak

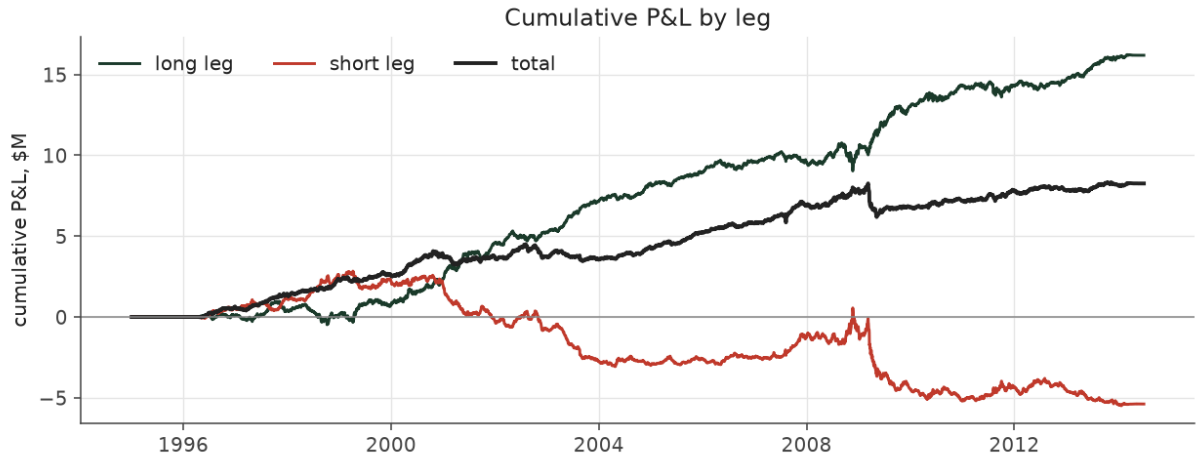

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	16.19	-5.39
P&L after costs ($M)	14.95	-6.69
of which common (average-event) component ($M)	8.99	-9.21
of which excess / PEAD component ($M)	7.20	3.82
excess minus costs ($M)	5.96	2.51
gross return per $ traded (bp)	277.94	-90.79
positions in the money (hit rate)	0.56	0.48
stand-alone Sharpe (leg only)	1.26	-0.36

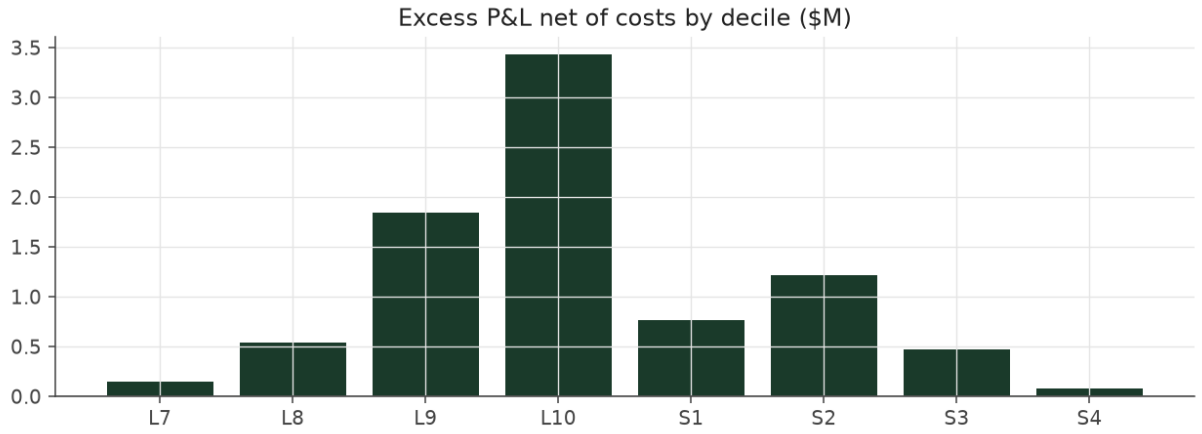

Daily P&L correlation between the two legs: **-0.79**.

• **The short leg loses money in absolute terms** (-5.4M before costs) while the long leg earns +16.2M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 9.0M / 9.2M. Stripping that common component, the surprise signal itself earned +7.2M on the long side and +3.8M on the short side.

• The two legs' daily P&L are -0.79 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 1.26 long / -0.36 short vs 1.08 combined).

By decile and side (signal-driven part only)

leg	decile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $
long	7	6,082	37.83	0.76	0.23	0.08	0.14	1.7%	38.00
long	8	16,057	127.06	2.81	0.81	0.27	0.54	6.4%	42.58
long	9	18,361	179.68	4.19	2.23	0.38	1.85	21.8%	102.81
long	10	20,072	238.05	7.19	3.94	0.51	3.43	40.5%	144.16
short	1	18,251	239.38	-3.19	1.31	0.55	0.76	9.0%	31.85
short	2	18,738	203.97	-1.97	1.65	0.44	1.21	14.3%	59.32
short	3	14,800	133.12	-1.39	0.75	0.28	0.47	5.5%	35.11
short	4	2,262	16.74	-0.14	0.11	0.03	0.07	0.9%	44.07

D10 and the short deciles carry the alpha; the middle of each leg earns little

By size quintile (1 = smallest)

size quintile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $

By idiosyncratic-volatility tercile

vol tercile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $
high vol	38,373	366.60	0.83	1.93	0.71	1.22	14.4%	33.27
low vol	38,203	409.42	3.77	4.83	0.98	3.85	45.4%	93.98
mid vol	36,279	376.16	3.32	3.89	0.80	3.09	36.5%	82.15

Short-borrow sensitivity (not modeled in the backtest)

borrow rate	fee M	ann. return	drag
0.0%	0.0	3.14%	-0.00%
0.5%	0.6	2.96%	0.18%
1.0%	1.2	2.78%	0.36%
2.0%	2.4	2.39%	0.75%
5.0%	6.1	1.02%	2.12%

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
