market_exposed

equity strategy | family: equity-directional | status: reference | derived from `balanced_leverage`

What this strategy does

Balanced Leverage signal, longs and shorts not forced to match, market moves left in

Why it should work. Let net exposure float with the signal; empirically this smuggles in uncontrolled market beta.

Design notes (from the strategy's source file).

Strategy 7 -- Unconstrained net exposure (cautionary result).

Strategy 5/6's signal, but the long and short legs are no longer forced to equal dollar totals, and returns are RAW so real market beta is carried. Net dollar exposure is only ~10% of gross (as in every other book) yet the book is 0.52-correlated with the market, because raw returns carry each stock's own beta and equal dollars long and short are not equal BETA: high-SUE and low-SUE firms differ in beta. Kept as a documented counter-example to the explicit beta overlay.

parameter	value
base_unit_fraction	0.003
max_gross_leverage	2.5
liquidity_cap_frac	0.05
return_basis	raw
cap_mode	priority
beta_overlay	0.0

Performance

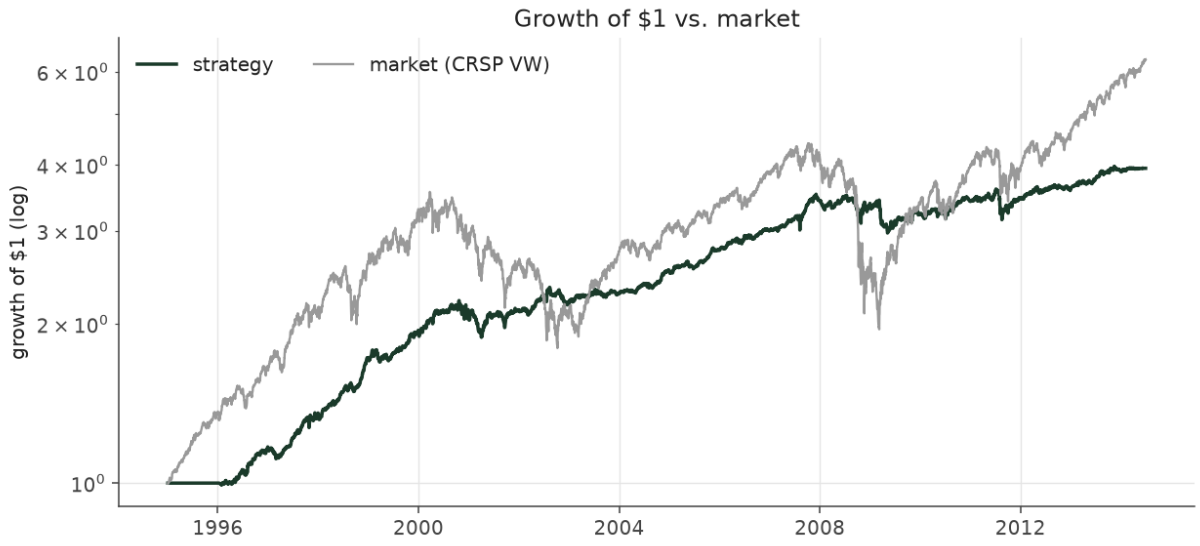

metric	market exposed	market (CRSP VW)
Annualized return	7.30%	9.94%
Annualized volatility	6.56%	19.35%
Sharpe (NAV-pct)	1.11	0.59
Sortino	1.61	
Max drawdown	-15.5%	-55.5%
Calmar	0.47	
Final NAV ($10M start)	$39,420,102	
Worst day	-3.54%	
% positive days	51.7%	
Sharpe 1996-2001	1.79	
Sharpe 2002-2007	1.48	
Sharpe 2008-2013	0.32	

Correlation of daily returns with the market: **0.52**.

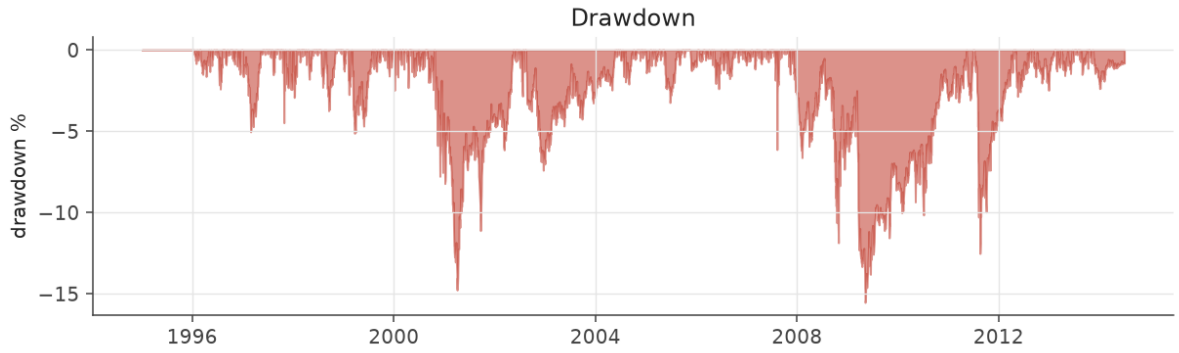

• best Sharpe among equity: `calm_rank_tilt` (1.81); this one: 1.11

• best return among equity: `market_boost_max` (0.15); this one: 0.073

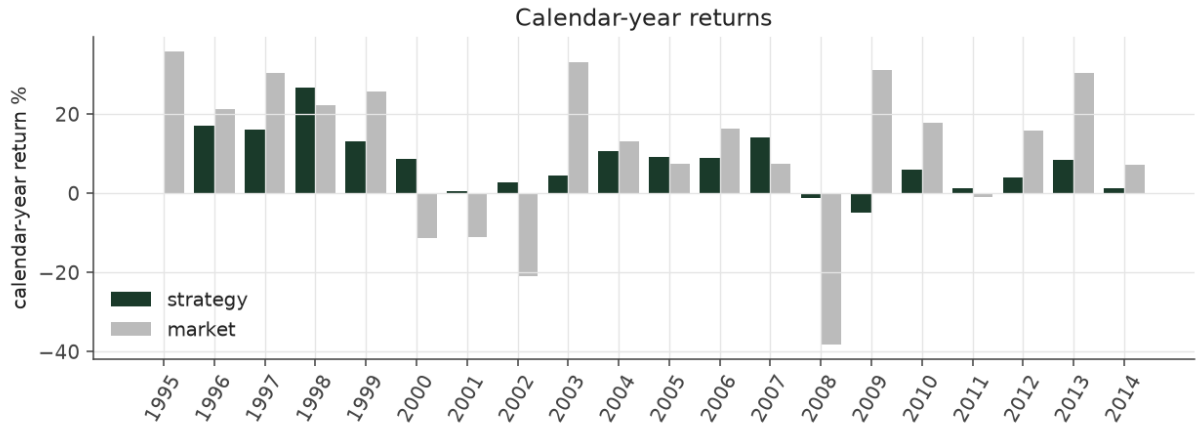

• best Calmar among equity: `calm_rank_tilt` (0.614); this one: 0.47

NAV (log scale)

Drawdown from running peak

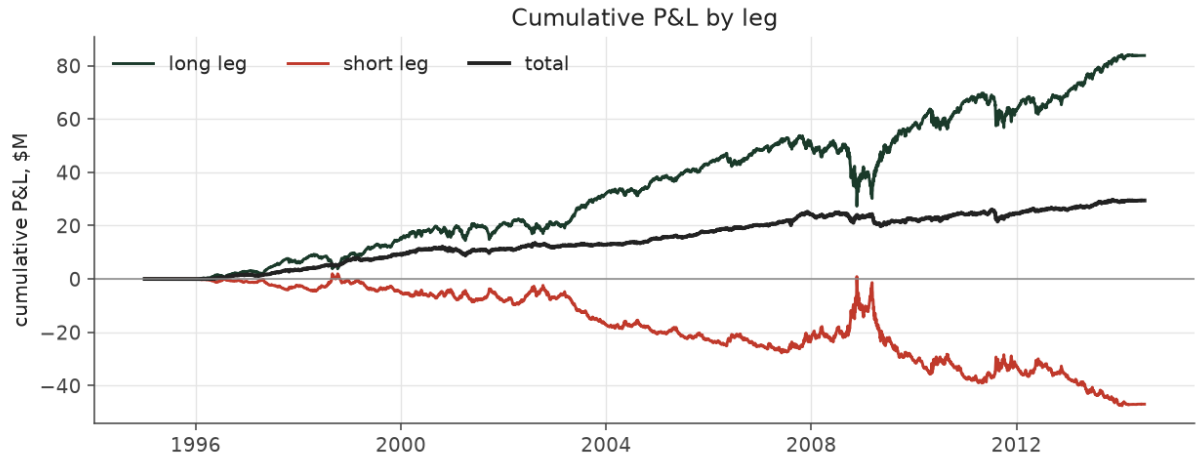

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	83.80	-46.97
P&L after costs ($M)	80.33	-50.91
of which common (average-event) component ($M)	29.35	-28.46
of which excess / PEAD component ($M)	14.08	16.52
excess minus costs ($M)	10.61	12.58
gross return per $ traded (bp)	453.74	-252.30
positions in the money (hit rate)	0.63	0.42
stand-alone Sharpe (leg only)	0.80	-0.48

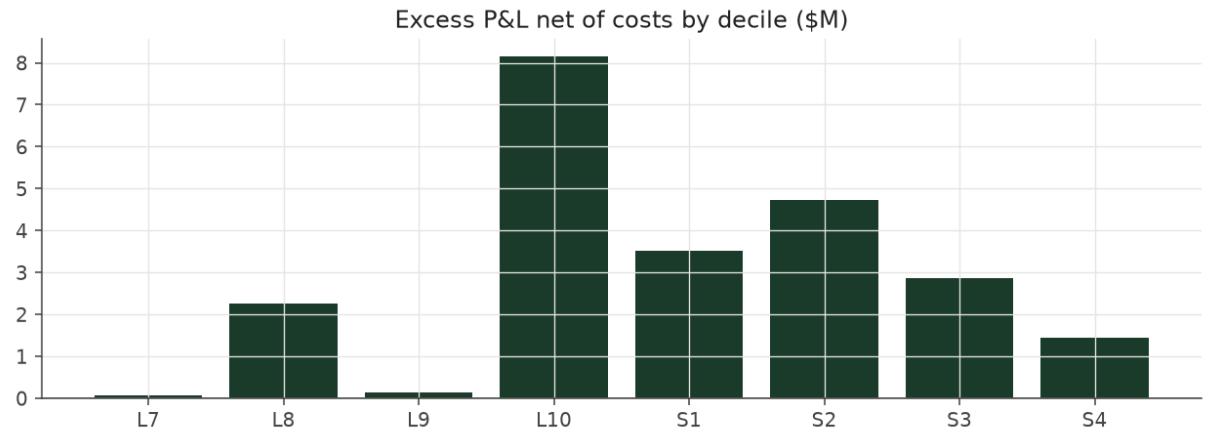

Daily P&L correlation between the two legs: **-0.97**.

• **The short leg loses money in absolute terms** (-47.0M before costs) while the long leg earns +83.8M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 29.3M / 28.5M. Stripping that common component, the surprise signal itself earned +14.1M on the long side and +16.5M on the short side.

• The two legs' daily P&L are -0.97 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 0.80 long / -0.48 short vs 1.11 combined).

By decile and side (signal-driven part only)

leg	decile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $
long	7	8,029	151.48	6.63	0.35	0.29	0.06	0.3%	3.97
long	8	16,588	419.95	18.91	3.06	0.80	2.26	9.8%	53.88
long	9	17,747	579.02	19.40	1.20	1.07	0.13	0.6%	2.31
long	10	17,174	696.43	35.39	9.47	1.32	8.16	35.2%	117.11
short	1	17,169	687.39	-20.20	5.02	1.50	3.52	15.2%	51.23
short	2	17,281	581.80	-15.87	5.95	1.21	4.74	20.4%	81.42
short	3	15,970	427.74	-10.65	3.77	0.90	2.88	12.4%	67.22
short	4	9,171	164.64	-4.20	1.78	0.33	1.45	6.2%	87.75

D10 and the short deciles carry the alpha; the middle of each leg earns little

Short-borrow sensitivity (not modeled in the backtest)

borrow rate	fee M	ann. return	drag
0.0%	0.0	7.30%	0.00%
0.5%	1.9	7.02%	0.27%
1.0%	3.8	6.74%	0.56%
2.0%	7.6	6.12%	1.18%
5.0%	19.1	3.72%	3.58%

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
