s6_neutral_levered_aggressive

equity strategy | family: equity-aggressive | status: research | derived from `s6_neutral_levered`

What this strategy does

s6_neutral_levered re-sized for return: base unit 0.012, 6x leverage cap

Why it should work. Market-neutral earnings drift with enough gross exposure to matter; the neutrality is the hedge.

Design notes (from the strategy's source file).

Aggressive-sizing variants of the hand-built equity strategies.

Same signal, trim, tilt and neutralization as each base strategy; only the two dials that set how big and how levered the book is change (base_unit_fraction, gross-leverage cap = 6x). The multiplier for each was picked by sweeping 1.5x..12x the original base unit and taking the highest return subject to Sharpe >= 0.6 and max drawdown >= -40% (a worse drawdown is a fund-ending event, not a risk preference). The untouched 5%-of-ADV liquidity cap remains the real capacity constraint, and bites roughly four times as often at this sizing.

These are generated from the base strategy classes, so a change to a base strategy's weights flows through automatically.

parameter	value
base_unit_fraction	0.012
max_gross_leverage	6.0
liquidity_cap_frac	0.05
return_basis	mktadj
cap_mode	priority
beta_overlay	0.0

Performance

metric	s6 neutral levered aggressive	market (CRSP VW)
Annualized return	12.15%	9.94%
Annualized volatility	12.20%	19.35%
Sharpe (NAV-pct)	1.00	0.59
Sortino	1.45	
Max drawdown	-36.5%	-55.5%
Calmar	0.33	
Final NAV ($10M start)	$93,270,642	
Worst day	-7.14%	
% positive days	51.5%	
Sharpe 1996-2001	1.53	

Sharpe 2002-2007	1.71	
Sharpe 2008-2013	-0.07	

Correlation of daily returns with the market: **-0.02**.

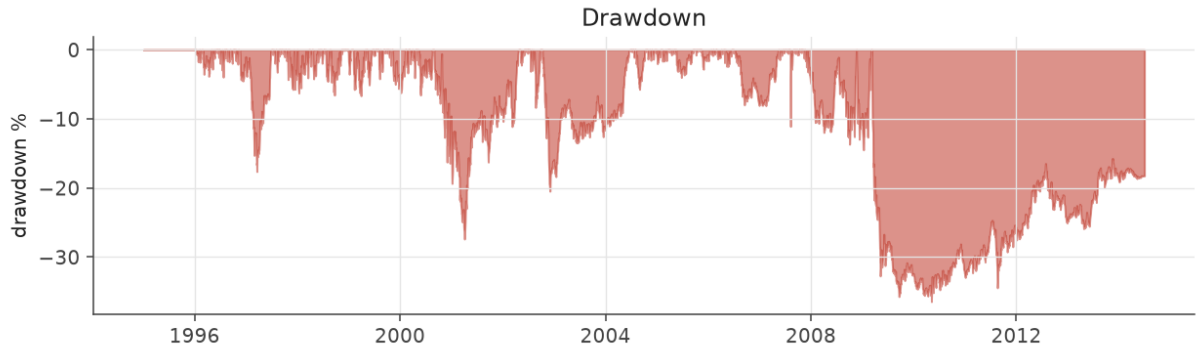

• best Sharpe among equity: `s10_vol_rank_tilt` (1.81); this one: 1

• best return among equity: `s6_beta_overlay_aggressive` (0.15); this one: 0.121

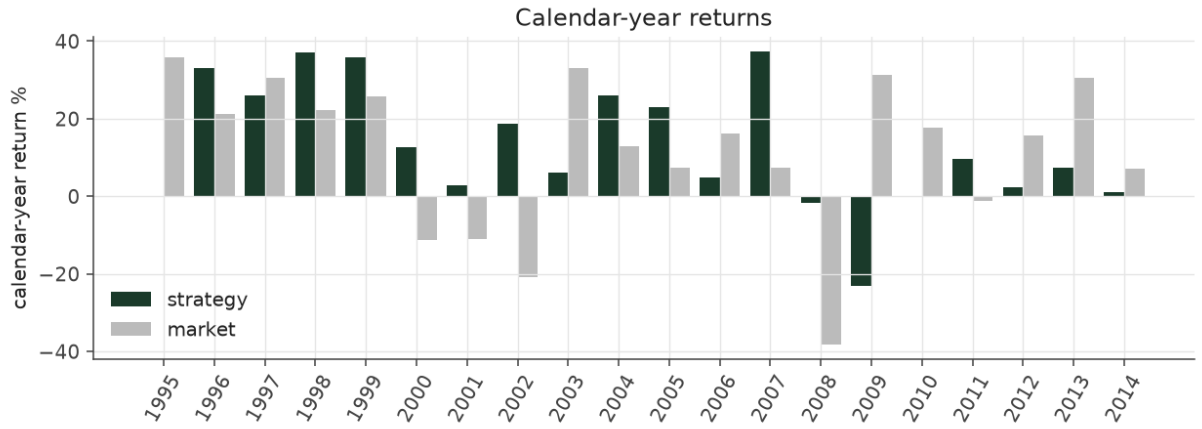

• best Calmar among equity: `s10_vol_rank_tilt` (0.614); this one: 0.333

NAV (log scale)

Drawdown from running peak

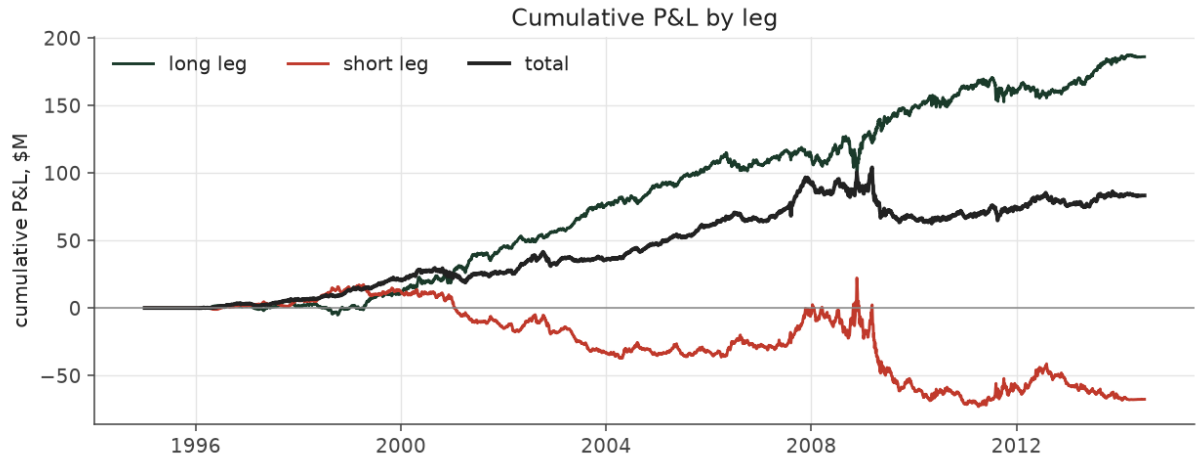

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	185.98	-67.62
P&L after costs ($M)	168.87	-85.60
of which common (average-event) component ($M)	174.40	-171.82

of which excess / PEAD component ($M)	11.58	104.20
excess minus costs ($M)	-5.54	86.22
gross return per $ traded (bp)	166.77	-59.88
positions in the money (hit rate)	0.56	0.49
stand-alone Sharpe (leg only)	1.06	-0.22

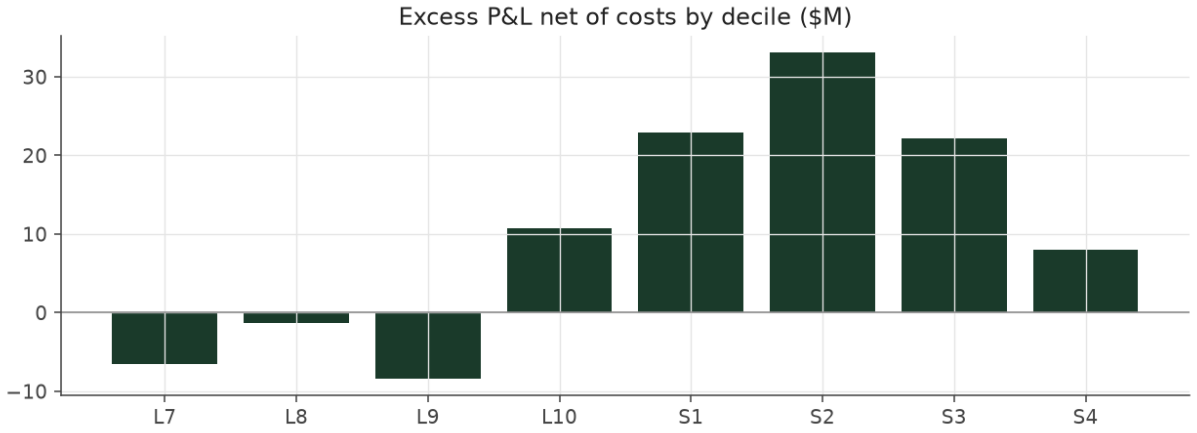

Daily P&L correlation between the two legs: **-0.77**.

• **The short leg loses money in absolute terms** (-67.6M before costs) while the long leg earns +186.0M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 174.4M / 171.8M. Stripping that common component, the surprise signal itself earned +11.6M on the long side and +104.2M on the short side.

• The two legs' daily P&L are -0.77 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 1.06 long / -0.22 short vs 1.00 combined).

By decile and side (signal-driven part only)

leg	decile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $
long	7	7,718	1,052.78	11.28	-4.89	1.67	-6.56	-8.1%	-62.28
long	8	16,225	2,721.85	42.43	2.92	4.23	-1.31	-1.6%	-4.80
long	9	17,480	3,520.62	43.56	-3.12	5.32	-8.44	-10.5%	-23.97

5.0%	107.4	-100.00%	112.15%

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
