calm_weighted_legacy

equity strategy | family: equity-volatility | status: reference | derived from `calm_weighted`

What this strategy does

Balanced Leverage, with each bet divided by how jumpy the stock is -- ORIGINAL leverage cap (new positions only, open book ignored)

Why it should work. PEAD is a stronger, cleaner signal in low-vol stocks; size positions by inverse risk.

Design notes (from the strategy's source file).

Calm Weighted -- Balanced Leverage, with bigger bets on calmer stocks (sized by inverse idiosyncratic volatility).

Within every (quarter, side, sector, size) cell, each event's weight is scaled by 1/ivol, so calm stocks get more capital than wild ones. Rationale: the earnings drift is worth more per unit of risk in low-vol names (the SUE x vol interaction is t = -2.4 to -2.7 in Fama-MacBeth), and the engine's cost/liquidity model charges the same bps regardless of vol. Raises Sharpe with no fitted parameter, in all three sub-eras (corrected run: Balanced Leverage 1.09 -> Calm Weighted 1.24; pre-fix 1.30 -> 1.47).

`CalmWeightedMatched` re-sizes it to Balanced Leverage's exact volatility to answer "at the SAME risk, how much more return" (corrected run: 5.83% vs 5.38%; pre-fix 7.31% vs 6.49%).

parameter	value
base_unit_fraction	0.003

Performance

metric	calm weighted legacy	market (CRSP VW)
Annualized return	6.71%	9.94%
Annualized volatility	4.49%	19.35%
Sharpe (NAV-pct)	1.47	0.59
Sortino	2.17	
Max drawdown	-15.6%	-55.5%
Calmar	0.43	
Final NAV ($10M start)	$35,421,134	
Worst day	-3.36%	
% positive days	52.4%	

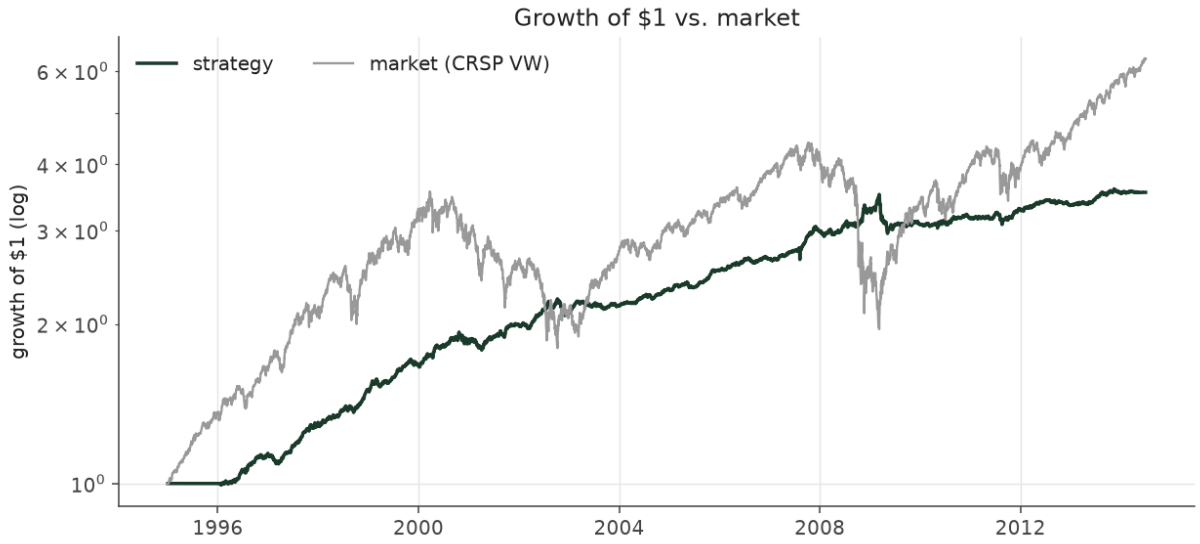

Sharpe 1996-2001	2.40	
Sharpe 2002-2007	1.63	
Sharpe 2008-2013	0.59	

Correlation of daily returns with the market: **0.01**.

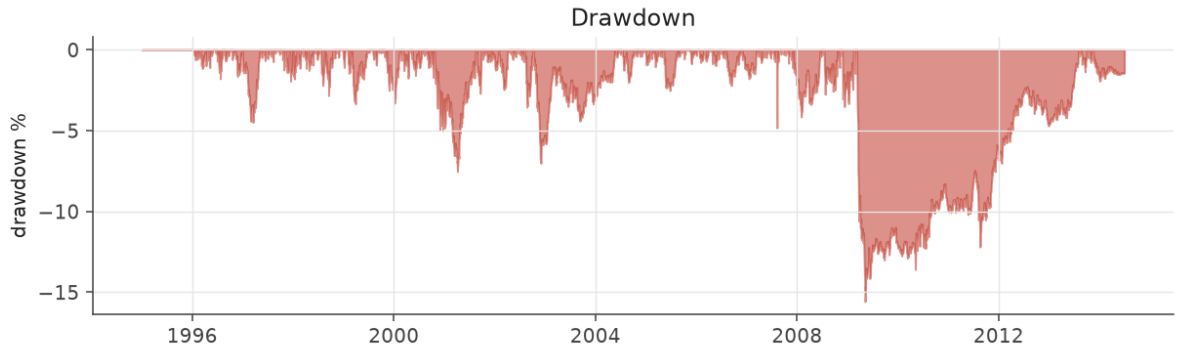

• best Sharpe among equity: `calm_rank_tilt` (1.47); this one: 1.47

• best return among equity: `market_boost_max` (0.116); this one: 0.0671

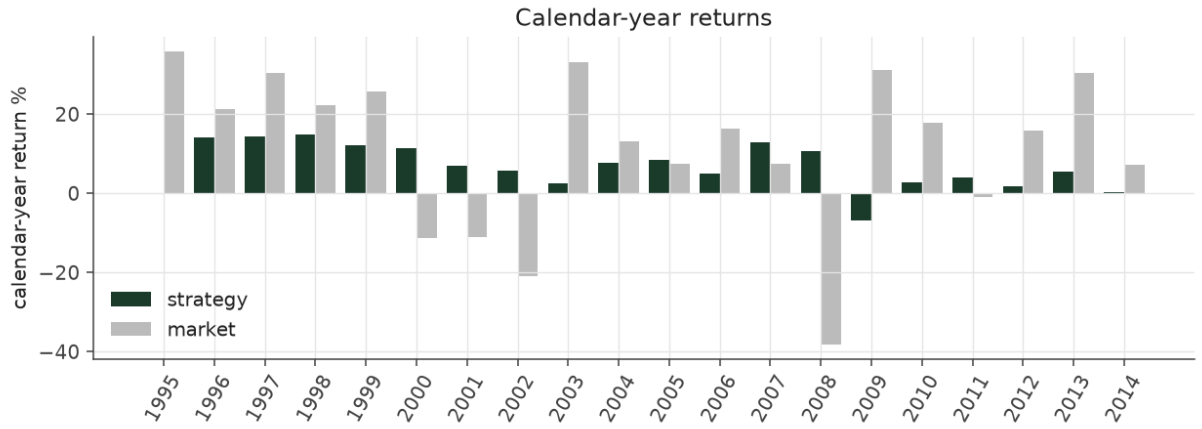

• best Calmar among equity: `calm_rank_tilt` (0.442); this one: 0.43

NAV (log scale)

Drawdown from running peak

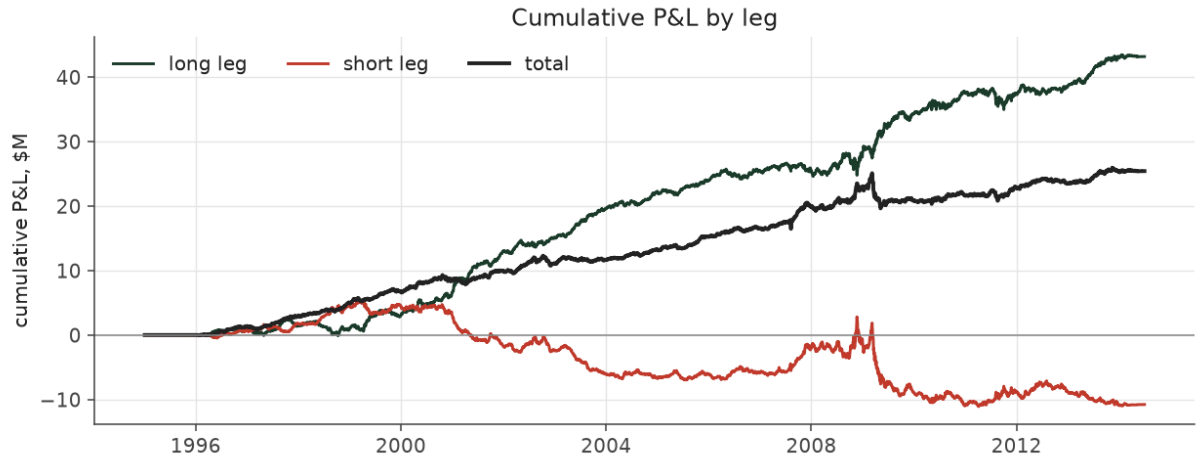

Calendar-year returns

Is the edge stable, or concentrated in a few years?

Where the return comes from

Long leg vs. short leg vs. total

	long leg	short leg
P&L ($M, before costs)	43.18	-10.78
P&L after costs ($M)	39.82	-14.40
of which common (average-event) component ($M)	26.87	-27.54

of which excess / PEAD component ($M)	15.89	17.07
excess minus costs ($M)	12.55	13.46
gross return per $ traded (bp)	253.23	-61.58
positions in the money (hit rate)	0.56	0.49
stand-alone Sharpe (leg only)	1.33	-0.23

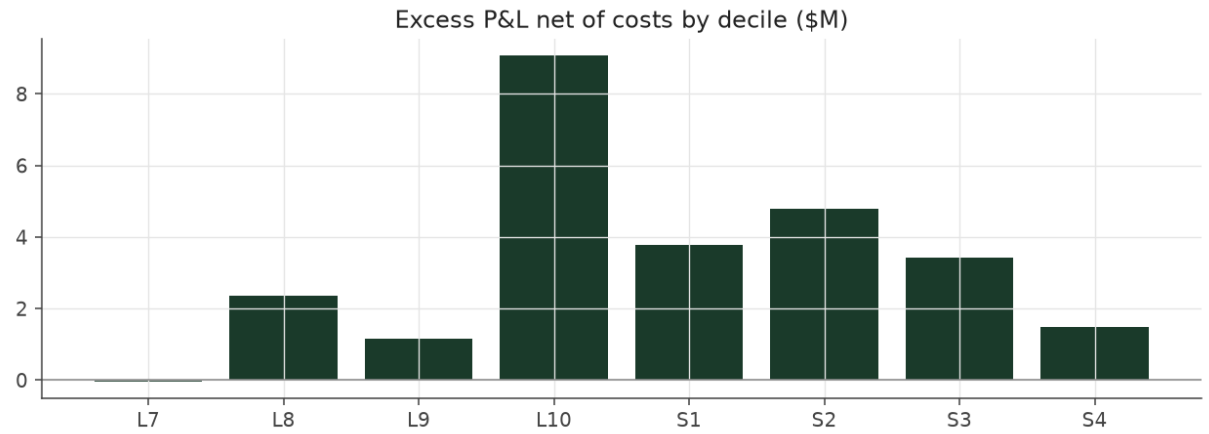

Daily P&L correlation between the two legs: **-0.81**.

• **The short leg loses money in absolute terms** (-10.8M before costs) while the long leg earns +43.2M. That is mostly a benchmark effect, not a signal failure: the average earnings-event stock beat the cap-weighted market during its holding window, which flatters the long leg and hurts the short leg by 26.9M / 27.5M. Stripping that common component, the surprise signal itself earned +15.9M on the long side and +17.1M on the short side.

• The two legs' daily P&L are -0.81 correlated: the short leg is the hedge that makes the long leg's variance disappear (stand-alone leg Sharpe 1.33 long / -0.23 short vs 1.47 combined).

By decile and side (signal-driven part only)

leg	decile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $
long	7	8,029	151.20	2.79	0.24	0.30	-0.05	-0.2%	-3.54
long	8	16,588	401.72	9.02	3.15	0.80	2.35	9.0%	58.56
long	9	17,747	528.00	8.81	2.19	1.02	1.17	4.5%	22.07
long	10	17,174	624.27	19.20	10.31	1.24	9.07	34.9%	145.32
short	1	17,169	625.49	-5.50	5.11	1.35	3.76	14.5%	60.16
short	2	17,281	542.85	-4.32	5.89	1.11	4.78	18.4%	88.01
short	3	15,970	414.21	-3.31	4.26	0.84	3.42	13.2%	82.66
short	4	9,171	168.10	-1.27	1.81	0.32	1.48	5.7%	88.22

D10 and the short deciles carry the alpha; the middle of each leg earns little

By size quintile (1 = smallest)

size quintile	positions	notional M	net pnl M	excess M	cost M	alpha net M	alpha share	alpha bp per $

mid vol	37,903	1,120.54	9.45	11.17	2.21	8.96	34.4%	79.93

Short-borrow sensitivity (not modeled in the backtest)

borrow rate	fee M	ann. return	drag
0.0%	0.0	6.71%	0.00%
0.5%	1.8	6.43%	0.28%
1.0%	3.5	6.13%	0.57%
2.0%	7.1	5.50%	1.21%
5.0%	17.7	2.99%	3.72%

The engine charges the same transaction cost on shorts as on longs and no stock-borrow fee. The short leg is concentrated in small, illiquid names, where borrow is scarce and expensive -- read the table as a floor on the cost of running the short leg.
